ThruVision Systems announces strong year to date sales

2011 has seen significant growth for ThruVision Systems with sales of its market leading stand-off people screening products for concealed object detection accelerating. The U.K. based high tech security company has been building its global sales channels which has led to increasing availability of its systems to potential customers worldwide.

ThruVision has long been associated with the provision of equipment for government authorities around the world. The interest in its people friendly screening equipment is now also proving to be of real interest within the private sector for a variety of security applications including entrance security and loss prevention.

ThruVision Systems is pleased to announce that during the first quarter of FY2011 sales have been made in Europe, Asia, North America and both Central and South America. These sales encompass both first time orders from new clients as well as repeat orders from existing customers.

With the increased demand for its stand-off screening products ThruVision Systems is continuing to develop its partner channels and the company's decision to work with experienced distributors is bearing fruit.

"We are very encouraged by the growth experienced so far this year" said Clive Beattie, ThruVision Systems' CEO, who added "our order pipeline is strong and we expect sales of our safe and non invasive people screening systems to continue growing in both the public and private sectors".

Notes to Editors

About ThruVision Systems

ThruVision Systems Ltd is a manufacturer of security screening products that incorporate proprietary passive terahertz imaging technology to detect person borne concealed objects. ThruVision Systems is based near Oxford, UK. Its security screening products are deployed in various locations in Europe, North America and the Middle East and Asia Pacific regions. Installations have included airports, border checkpoints, entrances to public buildings, shopping malls, sporting events and police deployments.

Technology background

All ThruVision Systems' products are passive. Images of concealed objects on people are formed by receiving low energy waves known as terahertz waves. Terahertz waves occupy part of the electromagnetic spectrum between radio waves and infra-red (heat). Terahertz waves are naturally produced all of the time by all objects and people. ThruVision Systems' products only receive, they do not transmit. ThruVision Systems' products do not illuminate people with any radiation such as X-rays or millimetre wave microwaves. The products provide imaging solutions for real time use on people either close by or at distance, indoors and out. For further information go to www.thruvision.com
